Research Experience

Zhejiang University, supervised by Yang Yang

2023.1 – 2024.2

Rethinking the Scoring Restrictions of Attentive Graph Neural Networks (second author)

ICML2024 under review

TL;DR: We propose using non-linear combination activation modules to address the issue of node order in Attentive GNNs, further enhancing the capability of Attentive GNNs.

[One Foundation Model for All Dynamic Link Prediction](#) (co-first author)

ICML2024 under review

TL;DR: This work proposes DyExpert, an autoregressive model consistent with the [GPT-2](#) architecture, which is a foundation model for link prediction on dynamic graphs.

Exploring Correlations of Self-supervised Tasks for Graphs (second author)

ICML2024 under review

TL;DR: We uncover the inherent correlations for various graph self-supervised tasks and propose a new method to achieve more expressive embeddings.

Making Diffusion Model acquire multi-resolution generalization ability (first author)

working paper

TL;DR: Contemporary diffusion models (DMs) suffer from a lack of generalization ability concerning image resolution; even minor variations in resolution can precipitate severe degradation in output quality. The ubiquity of stride-convolution for both up-sampling and down-sampling is well-noted for its myriad advantages. However, its usage inherently restricts DMs to operate at a singular, fixed resolution, hence impeding their scale generalization capability. To address this issue, we introduce an Two-Stage Fine-tune Method the for existing models to let it easily acquire (first-stage) and then enhance (second-stage) multi-resolution generalization ability. This strategy significantly enhances the scale generalization ability of diffusion models at a minimal cost, enabling them to produce outputs across a multitude of resolutions, including zero-shot resolutions. Additionally, our approach is characterized as an efficient and scalable method.

Auto-Encoding Morph-Tokens for Multimodal LLM (fifth author)

ICML2024 under review

TL;DR: We propose Morph-Tokenizer, which enables multimodal LLMs to possess simultaneous visual comprehension (textual output) and generation (visual output) capabilities.

Other Experience

Teacher Assistant in Zhejiang University

[211G0300] Fundamentals of Computer Science (B), 205 students

2023Fall

[2114N001] Introduction to Artificial Intelligence, 42 students

2023Fall

[211G0239] Introduction to Computer Science, 98 international students
